Course Outline Introduction

This course is a general introduction to chemistry, the scientific study of the composition and reaction of chemical substances as created by God. The topics of chemistry form a foundation for any future studies in the life and physical sciences, and cover a wide variety of important applications to agriculture, industry, technology, and the environment. The variety of assignments and tests will focus on factual information as well as understanding of concepts, practical experiments, research, and writing. **This course in chemistry will be different from all previous science courses in regard to the amount of mathematical calculations required;** therefore, math skills will be called upon. The goal of this course is to introduce the student to the language and systematic study of chemistry as well as to instill an appreciation and wonder of God's creation.

How to Work Through The Course

This course has been divided into a **140 day schedule**. This will allow the student to follow a **four-day school week** and still complete the course in a normal academic year. The **fifth day** of each week can be used to **catch up on assignments**, do **extra reading**, or simply **take the day off** from the course. If, however, a five-day school week is more desirable, the student is encouraged to pursue this course and will be rewarded by early completion of the material. Care has been taken to provide specific instructions for each day's work. Therefore, **all work is to be completed in the order presented in the daily schedule**.

Calculating Your Final Grade

Every module (chapter) of the course has either an assignment or a test to send for marking. **Please note that Tree of Life doesn't use the test package that comes with your textbook.** Your final mark in the course will be based on the following percentages:

6 Tests	50%
10 Assignments	50%

Assignment Expectations

Tests

Short answer tests should be written in complete sentences. Rarely should answers be more than a few sentences or a brief paragraph unless otherwise indicated. In these cases a short (one page) essay may be required to expand on the material learned throughout the year.

Lab Reports

Submitted lab reports demonstrate the stages of thinking about a particular scientific idea (asking a question, giving a possible solution, devising an experiment, making observations/measurements, providing a conclusion/answer to the question). Every lab report contains this format. A sample lab report is found in the appendix to this guide.

1. Title of Lab/course/name/date

The title of the lab should describe the experiment. Instead of “*Atmospheric Pressure,*” use “*The Effect of Atmospheric Pressure on Cans*”.

2. Problem 1-2 sentences

State the scientific question in the form of a question (ending in “?”). For example: “*What happens to the freezing point of water when salt is dissolved in the water?*” Depending on the experiment, you may also need to explain what the question means in connection with the experiment if it is not obvious.

3. Hypothesis 1-3 sentences

The hypothesis is an educated guess or possible answer to the problem, and is written before doing the experiment. The hypothesis should imply or state a prediction for what *should* happen during the experiment (not what *did* happen already). Also, the hypothesis may state a theory or reason for the prediction. For example: *The freezing point of water will decrease after dissolving the salt. Therefore, the pure water will freeze before the salt water. This is because the salt interferes with the formation of a solid crystal structure.* Note the “*will*” prediction in my example. Do not use “I believe” or “We think” at the beginning. Do not use past tense either as that would imply you already did the experiment.

4. Summary of Procedure max. 5 sentences

You do not need to give every detailed step of the experiment, nor every item you used. You should not copy the procedure from the textbook. This section should be at most 5 sentences. See sample lab report for example.

5. Observations and Results 1-2 paragraphs

Copyright Tree of Life School - Sample Only

The results section is an important part of the lab report because it describes what you discovered by doing the experiment. There are different kinds of results:

1. Sense observations (what you saw happening, smell, touch, sound, taste)
2. Measurements (numbers from measuring instruments)

Generally, you should always include some kind of sense observations in written form for every lab. Try to be as detailed as possible with your observations. Instead of saying “*The tablet reacted with the water*”, you could say:

“When the tablet was added to the glass of water, it began to bubble vigorously with a fizzing sound. Small bubbles came from the surface of the tablet. The tablet bounced around on the bottom of the glass. There was no smell from the reaction. The reaction lasted 22 seconds. After the reaction was done, the tablet was gone.”

Note that this example also has a measurement (22 seconds). Some experiments won't require any measurements, however. If the experiment involves many measurements, you should present these in a table. Note that the results section should **not** explain or interpret the results of the experiment (say what it means or why it happened). Save this for the conclusion. Just describe objectively what has occurred during the experiment.

6. Discussion and Conclusion 1-2 paragraphs

The conclusion paragraph of the lab report is not quite the same thing as an essay conclusion. The science conclusion should include the following things:

- Restate the problem and your hypothesis
- Summarize the results (what happened)...yes, write it again
- Answer the question (problem) you wrote at the beginning of the lab
- Say if the hypothesis was supported or rejected (not correct/incorrect)
- Explain the results as best you can (*why* did it happen?)
- You may need to mention some background theory that helps explain the results.

If you write at least 1 sentence per item above, you will have at least one good conclusion paragraph.

Bibliography

If you have used the ideas of others to help you form your thoughts for your assignment, you need to cite them at the end of your assignment in the bibliography. The format for the bibliography is different than for footnotes; merely copying and pasting your information will not be adequate.

Following you will find some common examples to help you.

Evaluative Comments and Grades

At the high school level, students are given numerical grades for each of their tests and assignments. We try to be as objective as we can be, but much of what we do is subjective by nature and with several people evaluating work, some will give higher grades than others. We make every effort to be on the same page (so to speak) so that there is not a wide disparity in grades from subject to subject (especially in those areas where much written work is submitted). We also make every effort to communicate to the student what was positive about the assignment and what needs work. If there is a question about a grade or comment on an assignment, we encourage you to communicate this to us. The best way is to send an e-mail or return the assignment with a note attached the next time you send work by mail. This way we can make sure that the evaluator who can best answer your question is notified and can have the opportunity to review the question and assignment and get back to you with what will hopefully be a satisfactory explanation.

Generally speaking, we employ the following percentages when marking work. We do not usually break down the mark to reflect this but hopefully the comments will reflect areas where the assignment may be improved.

Introduction 20%

Body 40%

Conclusion 20%

Style 10%

Mechanics 10%

Submitting Assignments for Evaluation

Email:

This is our highly preferred mode of submission, due to low cost and faster return rate of graded assignments.

1. **Most of the assignments and tests can be typed using the "Chemistry lab form" and Test forms, which are downloaded from the Tree of Life website. These files are pdf forms that you can type into and then email for marking. Save the proper pdf file onto your computer and then open it.**
2. Save each individual assignment as a Microsoft Word document (Word Perfect is also acceptable). Do not save a batch of assignments in one file; this will be returned ungraded to you. Study Guides for Great Ideas courses should also be sent as individual files.
3. Name the file with your name, the course, and the assignment number. For example, "John Doe_WH I_Essay 4" or "Sally Brown_GI I_ Confessions Study Guide".
4. Attach each assignment in a **separate email to evaluation@treeoflifeathome.com** **The subject line of your e-mail should be the same as the file name of your assignment.** This helps us organise the work and be sure it gets to the proper evaluator.

Regular mail:

Be sure *all* work is clearly labeled with your full name, course name, and assignment. Also, be aware this mode of submission will have the longest turnaround time.

How To Study Chemistry

Reading and Note-Taking

The backbone of the course is the textbook, which poses questions and provides scientific information and discussion in a very understandable and conversational tone. However, simply reading the textbook will yield little learning if there is no critical interaction with the material. One does not read science as one read novels of fiction, for example. Some people can read novels very quickly. But for science, you must slow down and sometimes read every word in the sentence to understand the concept. You might need to look back and forth five times between a diagram and a paragraph you are reading in order to “connect the dots”. This type of careful reading is necessary for learning science.

One very important learning method you should employ for this and following science courses is **note-taking** or **reading notes**. When reading a section of the textbook, you should always have at your side a notebook used for recording important terminology, definitions, explanations, facts, diagrams, and illustrations. The best time to write down notes is the moment your mind is on them. The purpose of reading notes is threefold. First, the act of note-taking forces you to think about what are the most important things in what is being said – that’s what to write down. Second, good notes give you a quick reference to the most important information from the textbook. You can find the main points more easily when studying for the test. Thirdly, as in the case of copying diagrams, note-taking causes you to look carefully and think harder about what you are looking at. If you take good notes while reading, you might accumulate 2-3 pages per module (not including practice questions).

How to use this Study Guide

This study guide is intended to provide a sequence of learning steps to pace you through the course. Each day gives a suggested number of pages for reading, practice questions, experiments, and tips. Some days will require more time and work; in this case, take an extra day if you need. If you are able to move faster, that’s fine too. However, good study habits are still important to develop, so following every lesson step is recommended. A good memory for terminology and concepts in science only goes so far, and a failure to develop study methods will eventually make learning harder or less enjoyable.

A few other tips and notes...

- Try to **follow the example calculations as closely as possible** - this includes numbers, units, chemical names/formulas, and equations. While different people have different ways of working out problems on paper, you should always follow a set procedure when you first learn things. Once you become comfortable and successful at the type of math in this chemistry course, then you can "skip" steps a bit.
- You should always check the **answers to the Practice Questions** (“On Your Own” questions); the answers are at the end of the module. Don’t “peek” if you aren’t sure of an answer; give your honest effort first, then check afterward.

Copyright Tree of Life School - Sample Only

- Keep up to date with the **Study Guide questions at the end of each module**. If you wait until the day before the test, they will be of little value in preparation. Perhaps doing about 3 study guide questions per day will help keep the material fresh in your mind.
- It is a good idea to **review the lab supplies required for different experiments *before*** the day of the lab. That way, you can be prepared. It is very important to pre-read the entire procedure for the experiment before you start.

Why should we do the experiments?

The experiments in this course are very important to do for several reasons. First, many experiments can help turn abstract scientific concepts into observable events and memorable pictures in your mind that help develop understanding. Another reason for the experiments is that they are fun and sometimes entertaining! They give variety to the course. Thirdly, experiments are an important activity of working scientists who make hypotheses about their observations in nature, and then set out to test their predictions within controlled conditions. Although you must learn the foundations of science before practicing like real scientists, the kind of experiments in this course emulate the same thinking processes in natural science. **You should do as many of the experiments in this course as possible, regardless of whether it needs to be evaluated.**

Daily Schedule

Module #1: Measurement and Units

DAY 1 - _____ (<write the date here)

- ⤴ Welcome to this study of Chemistry! This course guide will help you through the course and the evaluated assignments and tests. Before starting the learning material, you should read the introductory pages in this course outline (pages 9-10) so that you understand what is expected. You can also read the student notes in the textbook (pages i-iv) **but remember that the requirements to complete this course with Tree of Life are contained in this course outline.**
- ⤴ Preview Experiments 1.1 and 1.2 to make sure you have the necessary materials ready for tomorrow.

DAY 2 - _____

- ⤴ Conduct Experiments 1.1 and 1.2. For every experiment you complete in chemistry, you should carefully record your observations in a notebook. Then write 1-2 complete sentences that explains what has been concluded or learned from the experiment. For each of these two experiments, record your observations and write a summary conclusion.

DAY 3 - _____

- ⤴ Read pages 1-7.

DAY 4 - _____

- ⤴ Read pages 7(bottom)-11. **This section on converting units using the factor-label method is very important for later chemistry.** There is plenty of math in this chemistry course, so give yourself plenty of time to practice this skill. You should copy out the example calculations step-by-step into your notebook.
- ⤴ Complete On Your Own questions 1.1 - 1.5.

DAY 5 - _____

- ⤴ Read pages 11-16. Again, there are plenty of examples to follow. Make sure you go step by step and copy these examples in your notebook.

Copyright Tree of Life School - Sample Only

- ✦ Complete questions 1.6-1.11.

DAY 6 - _____

- ✦ Read pages 17-22.
- ✦ Complete question 1.12. Additionally, you can work on Practice Problems #1-6 at the end of the chapter on page 36.

DAY 7 - _____

- ✦ Read pages 23-27. Experiment 1.3 is optional.
- ✦ Complete questions 1.13 and 1.14.
- ✦ Preview Experiment 1.4 to make sure you have the necessary materials ready for tomorrow.

DAY 8 - _____

- ✦ Conduct Experiment 1.4. Again, record your observations or measurements and give a 1-2 sentence summary of conclusions. Try to write your conclusion before reading the textbook's explanation.

DAY 9 - _____

- ✦ Read pages 28-31.
- ✦ Complete questions 1.15 and 1.16 in your notebook.
- ✦ Answers for On Your Own questions can be checked at the end of the module.

DAY 10 - _____

- ✦ Complete Assignment #1 and submit for evaluation by mail (or scan + email). Assignment #1 is a practice of important calculations. Remember that you must show all steps and work in each answer.

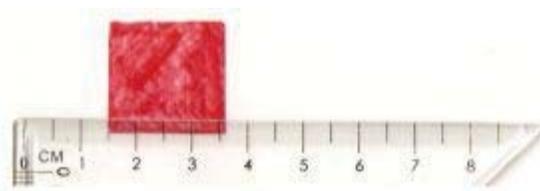

Note: the textbook contains plenty of Review Questions and Practice Problems at the end of modules. Although this course guide doesn't say to answer all of them, it is recommended that you complete most or all of these questions in your notebook at

Copyright Tree of Life School - Sample Only

Assignment 1 - Measurements in Science

Complete the following questions and submit by mail (or scan and email). Show all calculations and use the factor-label method. Write your calculations and answers on a blank page (not this page).

- Convert the following measurements to the base unit (grams/liters/meters).
 - 270 mg
 - 0.03 km
 - 11.345 dL
- Convert the following measurements from Imperial to Metric.
 - 250 gallons
 - 17.9 inches
 - 0.25 slugs
- Find the volume in milliliters of a rectangular container with dimensions 10 cm, 15 cm, and 20 cm.
- Determine the length of the red card in the following illustration. Give the measurement using the correct precision.

- Give the number of significant figures in each quantity.
 - 10.0 cm _____
 - 0.0203 mg _____
 - 5 m _____
 - 8000 km _____
 - 12345.6 s _____
 - 1.20×10^6 _____
- Calculate the following and give answers in correct numbers of significant figures.
 - $10.0 \text{ cm} + 8000 \text{ km}$
 - $8000 \text{ km} / 12345.6 \text{ s}$
 - $2.3 \text{ cm} \times 4.56 \text{ cm}$
- A piece of metal has mass of 0.226 kg and volume of 20 mL. Find the volume in g/mL.
